A Key To The Families of Marine Fishes of The West Coast ...

The marine fishes of North Carolina are much more difficult to quantify than the freshwater fishes. Freshwater fishes are contained in the particular river, creek, or lake in which they live, but non-native marine fishes could potentially get caught in the Gulf Stream, or drift with changing weather, and end up in state waters.

Everything from albacore to zebraperch! Descriptions and over 700 identifying illustrations of all 554 shallow-water marine species found along the California coast, from Oregon to Mexico. Includes geographical range for each species.

Key features include Over 950 illustrations of adults, juveniles, and color variants Descriptions of 157 fish families and almost 700 species Text presented adjacent to the illustrations Concise details about the biology, range, and distribution of each species Poised to become your go-to reference, this guide will find a welcome spot on your boat, in your backpack, or on your bookshelf.

Marine fishes have been intensively studied, and some of the fundamental ideas in the science of marine ecology have emerged from the body of knowledge derived from this diverse group of organisms. This unique, authoritative, and accessible reference, compiled by 35 luminary ecologists, evolutionary biologists, and ichthyologists, provides a synthesis and interpretation of the large, often daunting, body of information on the ecology of marine fishes. The focus is on the fauna of the eastern Pacific, especially the fishes of the California coast, a group among the most diverse and best studied of all marine ecosystems. A generously illustrated and comprehensive source of information, this volume will also be an important launching pad for future research and will shed new light on the study of marine fish ecology worldwide. The contributors touch on many fields in biology, including physiology, development, genetics, behavior, ecology, and evolution. The book includes sections on the history of research, both published and unpublished data, sections on collecting techniques, and references to important earlier studies.

"A masterful accomplishment—Allen, Pondella and Horn have assembled a talented team of experts who produce authoritative, up-to-date accounts. This book will be used as the primary text in many fish biology courses and as a valuable reference elsewhere. Here is a wealth of data waiting to be mined by legions of graduate students as they generate the new ideas that will motivate marine ecology for years."—Peter Sale, Editor of Coral Reef Fishes: Dynamics and Diversity in a Complex Ecosystem "A copiously illustrated and comprehensive interpretation of the past, present, and future state of over 500 species of fishes in Californian waters. A compilation of virtually all the many important studies on the ecology of California marine fishes."—Bruce B. Collette, National Marine Fisheries Service and co-author of The Diversity of Fishes

The updated and enlarged Second edition features more than 30 additional species and 70 new photographs. From the beautiful cool waters of Catalina Island to the frigid straits teaming with life in British Columbia, this book covers it all. This is the most comprehensive pictorial fish ID guide ever published for these waters. More than 320 superb color photos are presented in our popular, quick-reference format. Now in flexibinding (cloth stitched like hardcover, but a soft flexible cover like paperback).

"A handy guide to the freshwater fishes of California designed for amateur naturalists and anglers. Alcorn's illustrations are excellent."—Peter Moyle, author of Inland Fishes of California "Freshwater Fishes of California contributes to the better understanding of the past and present history and biology of native and non-native freshwater fishes of California. It also provides practical information on how to sample, care for and/or utilize these fishes. Moreover, it reads like a good novel that piques your interest on fish natural history and identification. It should be of value to anglers, environmentalists concerned with protection of our aquatic habitats and resource, natural history buffs, and governmental biologists and administrators."—Theodore W. Wooster, Environmental Specialist, retired, California Department of Fish and Game
