Human mitochondrial genetics is the study of the genetics of human mitochondrial DNA (the DNA contained in human mitochondria).The human mitochondrial genome is the entirety of hereditary information contained in human mitochondria. Mitochondria are small structures in cells that generate energy for the cell to use, and are hence referred to as the "powerhouses" of the cell.

*Human mitochondrial genetics - Wikipedia*

Human mitochondrial DNA was the first significant part of the human genome to be sequenced. This sequencing revealed that the human mtDNA includes 16,569 base pairs and encodes 13 proteins . Since animal mtDNA evolves faster than nuclear genetic markers, [5] [6] [7] it represents a mainstay of phylogenetics and evolutionary biology .

*Mitochondrial DNA - Wikipedia*

Mitochondrial DNA is the small circular chromosome found inside mitochondria. The mitochondria are organelles found in cells that are the sites of energy production. The mitochondria, and thus mitochondrial DNA, are passed from mother to offspring.

Mitochondrial DNA (mtDNA) is the physical embodiment of the genetic information encoded in the mitochondrion. Technically, the term 'mitochondrial DNA' encompasses not only the mitochondrial genome per se, but additional DNA types (e.g., small linear plasmid-like DNAs) that are present in the mitochondria of some organisms.

This genetic material is known as mitochondrial DNA or mtDNA. In humans, mitochondrial DNA spans about 16,500 DNA building blocks (base pairs), representing a small fraction of the total DNA in cells. Mitochondrial DNA contains 37 genes, all of which are essential for normal mitochondrial function.

Mitochondrial DNA (mtDNA) presents several characteristics useful for forensic studies, especially related to the lack of recombination, to a high copy number, and to matrilineal inheritance. mtDNA typing based on sequences of the control region or full genomic sequences analysis is used to analyze a variety of forensic samples such as old bones, teeth and hair, as well as other biological samples where the DNA content is low.

Mitochondria also have their own small genomes which are distinct from the genetic material on the 46 human chromosomes found within the nucleus of a cell (nuclear DNA). Mitochondrial DNA (mtDNA) is passed down exclusively from mother to child because mtDNA in sperm cells is lost during fertilization.

Abstract Mutational events along the human mtDNA phylogeny are traditionally identified relative to the revised Cambridge Reference Sequence, a contemporary European sequence published in 1981. This historical choice is a continuous source of inconsistencies, misinterpretations, and errors in medical, forensic, and population genetic studies.

While most DNA is contained in chromosomes, these ones are stored in the mitochondria. These elements are found in the cells around the body. What it does is take the food we eat and turn them into energy. There are thousands of these contained in every cell.

*Why is Mitochondrial DNA Important? - Why Guides*

Mitochondrial DNA (mtDNA) is the DNA located in mitochondria, which are cellular organelles within eukaryotic cells which transform chemical energy from food into adenosine triphosphate. Each cell contains hundreds to thousands of mitochondria, that are located in the fluid which surrounds the cytoplasm (the nucleus).
