This book will explore the questions raised by the

technological developments that have encouraged the multiplication of TV channels. TV is moving through a period of rapid change. Governments around the world are switching from analogue to digital forms of transmission to further expand the amount of content that TV signals can carry. At the same time, competition for eyeballs has also grown from outside that traditional marketplace with the emergence of the Internet. The roll-out of broadband and increased bandwidth has had the greatest impact on television because online technology can readily

convey the same content. All these changes have created a great deal more competition for viewers within the traditional TV marketplace. The Internet has proven to be especially popular with young people who have adopted its applications to a far greater extent than their elders, though even the latter have now begun to take up online activities in significant numbers. Are these audiences the same? Do people make a choice between these two media or do they use them both at different times and for different reasons? Can television utilise the Internet in profitable ways to enhance

its market position? Will television have to evolve from its current state to provide the kinds of content reception services to which people have become accustomed in the online world? If it does need to change to survive, will this nevertheless mean a radical new configuration of content and the disappearance of 'channels' with fixed, pre-determined programme schedules? Examines the implications of new interactive communications technologies for the way people will use television in the future Presents an analysis of changing styles of television viewing and

ranging analysis of online news. He offers important insights into key debates concerning the ways in which journalism is evolving on the internet, devoting particular attention to the factors influencing its development. Using a diverse range of examples, he shows how the forms, practices and epistemologies of online news are gradually becoming conventionalized, and assesses the implications for journalism's future. The rise of online news is examined with regard to the reporting of a series of major news events. The topics include coverage of the Oklahoma City bombing,

the Clinton-Lewinsky affair, the September 11 attacks, election campaigns, and the war in Iraq. The emergence of blogging is traced with an eye to its impact on journalism as a profession. The participatory journalism of news sites such as Indymedia, OhmyNews, and Wikinews is explored, as is the citizen journalist reporting of the South Asian tsunami, London bombings and Hurricane Katrina.

We study the impact of technology on the reaction of financial markets to information, focusing on the foreign exchange market. We contrast the “thin-skinned”

view that technological improvements cause markets to react more to new information with the “thick-skinned” view that they react less. We pinpoint exogenous technological changes using the timing of the connection of countries via the submarine fiber-optic cables used for electronic trading. Cable connections dampen the response of exchange rates to macroeconomic news, consistent with the “thick-skinned” hypothesis. This is in line with the view that technology eases access to information and reduces trend-following behavior. According to our estimates,

cable connections reduce the reaction of exchange rates to U.S. monetary policy news by 50 to 80 percent.

This multi-authored scholarly volume explores the divide between men and women in their consumption of news media, looking at how the sexes read and use news, historically and currently, how they use technology to access their news, and how today's news pertains to and is used by women. The volume also addresses diversity issues among women's use of news, considering racial, ethnic, international and feminist perspectives. The volume is

intended to help readers understand adult news use behavior--a critical and timely issue considering the state of newspapers and television news in today's multi-media news environment.

This book analyzes various digital transformation processes in journalism and news media. By investigating how these processes stimulate innovation, the authors identify new business and communication models, as well as digital strategies for a new environment of global information flows. The book will help journalists and

practitioners working in news media to identify best practices and discover new types of information flows in a rapidly changing news media landscape.

"As traditional for-profit news media in the United States declines in economic viability and sheer numbers of outlets and staff, what does and what should the constitutional guarantee of freedom of the press mean? The book examines the current news ecosystem in the U.S. and chronicles historical developments in government involvement in shaping the industry. It argues that initiatives by

the government and by private-sector actors are not only permitted but called for as transformations in technology, economics, and communications jeopardize the production and distribution of and trust in news and the very existence of local news reporting. It presents ten proposals for change to help preserve the free press essential to our democratic society"--

The future of journalism isn't what it used to be. As recently as the mid-1960s, few would have predicted the shocks and transformations that have swept through the

news business in the last three decades: the deaths of many afternoon newspapers, the emergence of television as people's primary news source and the quicksilver combinations of cable television, VCRs and the Internet that have changed our ways of reading, seeing, and listening. The essays in this volume seek to illuminate the future prospects of journalism. Mindful that grandiose predictions of the world of tomorrow tend to be the fantasies and phobias of the present written large—in the 1930s and 1940s magazines such as Scribner's, Barron's, and Collier's

forecast that one day we would have an airplane in every garage—the authors of *What's Next?* have taken a more careful view. The writers start with what they know—the trends that they see in journalism today—and ask where will they take us in the foreseeable future. For some media, such as newspapers, the visible horizon is decades away. For others, particularly anything involving the Internet, responsible forecasts can look ahead only for a matter of years. Where the likely destinations of present trends are not entirely clear, the authors have

tried to pose the kinds of questions that they believe people will have to address in years to come. While being mindful of the tremendous influence of technology, one must remember that computers, punditry, or market share will not ordain the future of journalism. Rather, it will be determined by the sum of countless actions taken by journalists and other media professionals. These essays, with their hopes and fears, cautions and enthusiasms, questions and answers, are an effort to create the best possible future for journalism. This volume will be of interest

Click on Democracy examines the first national election in which the Internet played a major role. The contributors argue that the Internet's most profound political impact on Election 2000 has largely been missed or underestimated. The reason: the difference it made was more social than electoral, more about building political communities than about generating votes and money. The contributors to Click on Democracy talk at length with the people who are using the Internet in new and effective ways, and who are capitalizing on the Internet's power as a

networking tool for civic action. Viewed from this bottom-up perspective, the Internet emerges as an exciting and powerful source of renewal for civic engagement. The new foreword is from Scott Heiferman and William Finkel, both of Meetup, Inc.

The Internet in China examines the cultural and political ramifications of the Internet for Chinese society. The rapid growth of the Internet has been enthusiastically embraced by the Chinese government, but the government has also rushed to seize control of the virtual environment.

Individuals have responded with impassioned campaigns against official control of information. The emergence of a civil society via cyberspace has had profound effects upon China--for example, in 2003, based on an Internet campaign, the Chinese Supreme People's Court overturned the ruling of a local court for the first time since the Communist Party came to power in 1949. The important question this book asks is not whether the Internet will democratize China, but rather in what ways the Internet is democratizing communication in China. How is the Internet empowering

individuals by fostering new types of social spaces and redefining existing social relations?

This unique book adopts a problem approach to study the Internet economy, which consists in assessing its contradiction to classic economy, analyzing it, and describing how the Internet economy is developing in modern Russia. The authors study its sense and basic principles, identify the factors that influence its functioning and development, analyze the crisis of the Internet economy, and conduct a comparative analysis of the Internet

economy and classic economy. The book is primarily intended for postgraduates, educators and researchers who study the foundations of the modern macro-economy. Based on the conclusions and results presented here, they will be able to create their own scientific studies. Further, problem analysis of the Internet economy and classic economy makes it possible to identify the peculiarities and prospects of development, and to form recommendations for the highly effective management of modern economic systems.
