Object-Oriented Design. In the object-oriented design method, the system is viewed as a collection of objects (i.e., entities). The state is distributed among the objects, and each object handles its state data. For example, in a Library Automation Software, each library representative may be a separate object with its data and functions to operate on these data.

Object oriented programming will at times model the real world, but as the old saying goes "all models are wrong, but some are useful". Even in the real world, changing the color of the car doesn't involve changing the state of the atoms in the car, but adding new ones that have the new color.

The main aim of Object Oriented Design (OOD) is to improve the quality and productivity of system analysis and design by making it more usable. In analysis phase, OO models are used to fill the gap between problem and solution. It performs well in situation where systems are undergoing continuous design, adaption, and maintenance.
