This dissertation approaches the question of sustainability and its influence on company performance, with special focus on the manufacturing industry. In the contemporary production environment, manufacturing operations must take into account not only profit, but also environmental and social performance, in order to ensure the long-term development of the company. Companies have to decide whether they should allocate resources to environmental and social practices in order to improve their competitive advantage. Consequently, in decision-making processes concerning operations, it is important for companies to understand how to coordinate profit, people, and planet. The objective of this dissertation was to investigate the current situation regarding manufacturers' sustainable initiatives, and to explore the relationship between these sustainable practices and companies' performance, including financial performance, operational performance, innovation performance, environmental performance, and social performance. First of all, a structured literature review was conducted to identify sustainable factors considered to be important in the decision making of manufacturing operations. The findings were synthesized into a conceptual model, which was then adopted as the basis for designing the survey instrument used in this dissertation. Drawing on Global Reporting Initiative (GRI) reports, empirical research was performed to explore the relationship between environmental management practices and company performance. Interestingly, the findings showed that many environmental management

practices had a strong positive impact on innovation performance. Sustainability disclosures and financial performance were further analyzed using extended data from the GRI reports. The results also showed that several sustainability performance indicators, such as product responsibility, human rights, and society, displayed a significant and positive correlation with return on equity in the sample companies. In order to further explore the research area and to verify these findings, a triangulation approach was adopted and new data were collected via a survey conducted among middle and large sample companies in the Swedish manufacturing industry. The results indicated that the sustainable improvement practices had a positive impact on company performance. Some environmental and social improvement practices had a direct and positive correlation with product and process innovation. Furthermore, findings suggested that better cooperation with suppliers on environmental work could help to strengthen the organizational green capabilities of the focal companies. When considering the company's general approach to implementing sustainable practices, some interesting findings emerged. There were limited significant differences in sustainable practices when comparing different manufacturing sectors, and different countries and regions. However, the results showed that Swedish manufacturing companies often place higher priority on implementing economic and environmental sustainability practices than on social ones. This dissertation contributes to the literature on manufacturing sustainability. The study expands the understanding of how environmental, social, or economic perspectives as a triple bottom line can influence company performance and to a certain extent the supply chain. Identifying and understanding such relationships gives companies the opportunity to integrate sustainability into their

manufacturing operations strategy in order to sustain their manufacturing operations over the long term.

Providing a timely contribution to the ongoing questions surrounding topics which are by definition subject to varying stakeholder interpretations, this book addresses “the missing link” between theoretical CSR concepts and everyday management practice. It acts as a guide to awaken managers to the advantages of adopting a CSR “mindset” when developing sustainable business strategies. The book consists of three parts: 1) A theoretical realm which establishes the key concepts and rationale for the adoption of a sustainable CSR approach, 2) A practical realm which addresses putting CSR and sustainability into business practice, 3) An educational realm which proposes how to incorporate the concepts into teaching and training.

The Internet is connecting an increasing number of individuals, organizations, and devices into global networks of information flows. It is accelerating the dynamics of innovation in the digital economy, affecting the nature and intensity of competition, and enabling private companies, governments, and the non-profit sector to develop new business models. In this new ecosystem many of the theoretical assumptions and historical observations upon which economics rests are altered and need critical reassessment.

The construction industry is associated with problems such as low productivity and high costs. This has been highlighted in several government-funded reports in both Sweden and in the UK during the course of over two decades. The construction industry is a large industry sector employing hundreds of thousands and a large contributor to a country's GDP. The problems therefore have a large impact on society.

Some of the problems are rooted in the organizational structure of the construction industry. Compared to other manufacturing industries, the construction industry is organized in temporary organizations. The temporary organizations cause temporary supply chains, fragmentation among construction industry actors and adversarial relationships between those actors. Partnering has been put forward as a solution to overcome the temporariness and the adversarial relationships in the construction. Another solution to mitigate the problems suggested in the reports is supply chain management (SCM). Both concepts have been taken from the manufacturing industries and partnering has been more successful compared to SCM in the construction industry. In the construction industry the progress towards SCM has focused on logistics. In recent years dedicated third-party logistics (TPL) solutions have emerged in the Swedish construction industry, where a company is hired to manage the logistics in a construction project. The purpose with the research presented in this licentiate thesis is to explore how client initiated TPL solutions and partnering can be facilitators for SCM in the construction industry. Being a new phenomenon in the construction industry TPL solutions provide a logistical competence not necessarily included in a traditional construction project. Therefore, TPL solutions are of particular interest when studying the realization of SCM in the construction industry. In the process of realizing SCM in the construction industry, the construction clients have been put forward as having a crucial and important role. The clients are the initiator and funder of construction projects and as such the client can influence the course of a construction project. Therefore, it is of interest to study how the client can take an active role in this process. Initiating a TPL solution in a construction project is one way for a client to take an active part in the realization of SCM in construction. However, in

order to study how clients can take an active role towards the realization of SCM in the construction industry, there have to be an understanding of how SCM is to be adopted to the construction industry context. SCM that derives from the manufacturing industry is designed to be used in long-term relationships with permanent organizational structures. The construction industry on the other hand is associated with short-term relationships and a temporary organizational structure. Partnering that is designed to mitigate the temporariness and establish long-term relationships have been quite successful in the construction industry, and could therefore be used as a facilitator for SCM in construction. To study the use of client initiated TPL-solutions in construction and the realization of SCM in the construction industry the following research questions have been addressed: RQ1: To what extent can a third-party logistics solution be a facilitator for client driven SCM in the construction industry? RQ2: How will upstream and downstream tiers be affected when a thirdparty logistics provider is used in a construction project? RQ3: How can partnering be used a mean to facilitate the realization of SCM in the construction industry? To answer the research questions two main methodologies have been used; case study for the empirically grounded research and conceptual studies for the analysis of the case studies as well as for comparing the two concepts of partnering and SCM. All questions have been grounded in literature and previous research. The findings of this research is therefore grounded in both theory and in practice. The main findings of this research is that TPL solutions are not a quick fix for realizing SCM in the construction industry. However, if used right a TPL solution can be an effective tool to address logistical issues in a construction project and to establish an interface between the supply chain and the construction site. By initiating a TPL solution the client addresses the

importance of logistical competence in a construction project. A TPL solution does not have a purpose of its own; a TPL solution is a service function to the construction project, providing expertise on logistics management. There are also a number of driving forces and concerns that have been identified, if they are addressed prior to a TPL solution is implemented, the likelihood of its success will increase. Furthermore, both partnering and SCM rely on high trust and share several key components and issues that have to be addressed. Partnering on strategic level with several suppliers included can even be hard to distinguish from SCM. Wherefore, partnering is considered a facilitator for the realization of SCM in construction. By addressing the necessary issues in both concepts a good foundation for SCM is established.

Routledge Handbook of the Economics of European Integration provides readers with a brief but comprehensive overview of topics related to the process of European integration in the post-World War II period. Its short chapters reflect the most up-to-date and concise research, written by a collective of experts on their own subjects. The aim of this book is twofold. Firstly, the text illustrates the broad and diverse range of issues associated with European integration, and lastly, the key approaches and findings are summarised. Since institutional integration in Europe is an ongoing process, with possibly frequent and sometimes rapid changes, the chapters are intended to focus on the key features of the economic analyses of these topics. A wide and diverse set of economic issues is of direct relevance for European integration. These topics cover various fields, ranging from the history of the European Economic and Monetary Union, EU Trade Policy and the stability of international trade, single market issues over fiscal, monetary

and other policies, the crisis that faces the Euro area, and institutions such as EU Council of Ministers. Not surprisingly, many of these issues have also been analysed from a European perspective. This handbook is designed to provide students, researchers, the public and policy makers with ready and accessible knowledge of issues related to European integration and will provide the definitive overview of research in the area.

Economics of Immigration provides students with the tools needed to examine the economic impact of immigration and immigration policies over the past century. Students will develop an understanding of why and how people migrate across borders and will learn how to analyze the economic causes and effects of immigration. The main objectives of the book are for students to understand the decision to migrate; to understand the impact of immigration on markets and government budgets; and to understand the consequences of immigration policies in a global context. From the first chapter, students will develop an appreciation of the importance of immigration as a separate academic field within labor economics and international economics. Topics covered include the effect of immigration on labor markets, housing markets, international trade, tax revenues, human capital accumulation, and government fiscal balances. The book also considers the impact of immigration on what firms choose to produce, and even on the ethnic diversity of restaurants and on financial markets, as well as the theory and evidence on immigrants' economic assimilation. The textbook includes a comparative study of immigration policies in a number of immigrant-receiving and sending countries, beginning with the history of immigration policy in the United States. Finally, the book explores immigration topics that directly affect developing countries, such as remittances, brain drain,

human trafficking, and rural-urban internal migration. Readers will also be fully equipped with the tools needed to understand and contribute to policy debates on this controversial topic. This is the first textbook to comprehensively cover the economics of immigration, and it is suitable both for economics students and for students studying migration in other disciplines, such as sociology and politics.

It would be fair to say that foreign aid today is one of the most important factors in international relations and in the national economy of many countries – as well as one of the most researched fields in economics. Although much has been written on the subject of foreign aid, this book contributes by taking stock of knowledge in the field, with chapters summarizing long-standing debates as well as the latest advances. Several contributions provide new analytical insights or empirical evidence on different aspects of aid, including how aid may be linked to trade and the motives for aid giving. As a whole, the book demonstrates how researchers have dealt with increasingly complex issues over time – both theoretical and empirical – on the allocation, impact, and efficacy of aid, with aid policies placed at the center of the discussion. In addition to students, academics, researchers, and policymakers involved in development economics and foreign aid, this Handbook will appeal to all those interested in development issues and international policies.

the role of BRICS in the global economy and explores the interrelatedness of business cycles within BRICS. In turn, part two provides studies on the historical development of business cycles in the individual BRICS countries and describes the driving forces behind those cycles. Parts three and four present national business tendency surveys and composite cyclical indices for real-time monitoring and forecasting of various BRICS economies, while the final part discusses how the lessons learned in the BRICS countries can be used for the analysis of business cycles and their socio-political consequences in other emerging countries.

"Law and economics" involves the application of economic analysis to legal problems. Law and economics features in public policy debates as well as across the social sciences in fields such as political economy, constitutional economics, and political science. *Concepts in Law and Economics: A Guide for the Curious* provides a comprehensive integration of the fields of law and economics. In clear prose, Jim Leitzel challenges traditional approaches to law and economics and uncovers common themes that cut across the two fields, providing readers with a means of integrating their knowledge to examine problems through both a legal and economic lens. This book covers the major methods of law and economics and applies those methods to various issues, including art vandalism, sales of human kidneys, and the ownership of meteorites. Compact yet comprehensive, this is an ideal introduction to a vast number of concepts and controversies in the fields of law and economics. Economics students, law students, and those with a general interest in the social sciences will find *Concepts in Law and Economics* an interesting and engaging read, and will emerge with the necessary skills for thinking like a law and economics practitioner.

The interventions of crisis management during the 2007 to 2011 financial crisis were not simply responses to a set of given developments in markets, banking or neo-liberal capitalism. Nor can those interventions be adequately explained as the actions of sovereign state officials and institutions. Instead, Langley argues, processes of crisis governance are shown to have established six principal technical problems to be acted upon: liquidity, toxicity, solvency, risk, regulation, and debt and that the governance of these technical problems, is shown to have been strategically assembled in order to secure the continuation of a particular, financialized way of life that depends upon global financial circulations. Contributing to interdisciplinary debates in cultural economy and the social studies of finance, and grounded in extensive empirical research, this book offers an innovative analysis of how the contemporary global financial crisis was governed. Through an exploration of the interventions made by central banks, treasuries, and regulatory authorities in the Anglo-American heartland of the crisis between 2007 and 2011, experimental and strategic apparatuses of crisis governance are shown to have emerged. These discrete apparatuses established the six technical problems to be acted upon, but also shared certain proclivities and preferences. Crisis governance assembled discourses and devices of economy in relation with sovereign monetary, fiscal, and regulatory techniques, and elicited an affective atmosphere of confidence. It also sought to secure the financialized way of life which turns on the opportunities ostensibly afforded by uncertain financial circulations, and gave rise to post-crisis technical fixes designed to advance the resilience of banking and the macro-prudential regulation of financial stability. Thus, the consensus that prevails across economics, political economy, and beyond - wherein

sovereign state institutions are cast as coming to the rescue of the markets, banking, or neo-liberal capitalism - conceals a great deal more than it reveals about the governance of the global financial crisis.
