The phasor diagram for these two oscillations looks like this:

The resultant phasor can be determined from the vector

addition of the phasors. Phasor $x = 12.5 \cos(6t)$ and $y = 25 \sin(6t)$
 $= 21.6 = 12.5 \cos(6t) + 25 \sin(6t)$
 $= 7.5 = 13.0$ Total 29.1 25.5

So, the amplitude of the resultant phasor is $A_{tot} = 29.12 + 25.52 = 38.7 \text{ cm}$, and its initial phase ...

AC Systems and Phasors

Phasor notation proves extremely useful to compare or combine AC quantities at the same frequency that are out-of-phase with each other. Consider the following example, showing two AC voltage waveforms of equal magnitude (5 volts peak) that are a constant 60 degrees ($\pi/3$ radians) out of step with each other:

Example 1.1: Basic Phasor Transform Problem: Convert the function $7\sin(2 \pi t)$ into the phasor domain and then back into the time domain. Solution: 1. To go into the phasor domain, we first recognize that if $x(t) = 7\sin(2 \pi t)$, we may also write this as ...

NOTES ON PHASORS

One key phasor property is the additive property. If you add sinusoids that have the same frequency, then the resulting phasor is simply the vector sum of the phasors — just like adding vectors: $V = V_1 + V_2 + \dots + V_N$. For this equation to work, phasors V_1, V_2, \dots, V_N must have the same frequency. You find this property useful when using ...

4 You can visualize these using an Argand diagram, which is just a plot of imaginary part vs. real part of a complex number. For example, $z = 3 + j4 = 5e^{j0.927}$ is plotted at rectangular coordinates (3,4) and polar coordinates (5,0.927), where 0.927 is the angle in radians measured counterclockwise from the positive real

A phasor can also be expressed in rectangular form, i.e., as a complex number consisting of a real part and an imaginary part (in the context of circuit analysis, the imaginary portion of a complex number is preceded by the letter j instead of i). For example: Thus, the polar-form phasor $5 \angle 36.87^\circ$
