Triangulation Development Method Engineering Drawing

Triangulation is a geometric development process used to create patterns of conical and transition shapes. Triangulation allows you to determine the true length of a line or surface on a drawing by creating a right angled triangle. Look at the diagram below. A right angled triangle is formed by taking the distance between two points (example C7) on the top view, placed against the vertical height (example - the centre line of the front view) of the shape.

In triangulation, you compare the angles of the sides of a triangle formed by three points on your drawing with the same triangle on the subject. This results in accurate proportions. It is the single most important drawing technique to learn. It is rather tedious to start with, but becomes very fast once you are proficient at it.

The development is commenced by drawing the figure CDFG, and the centre line of this part can be obtained from the front elevation which appears as line CG, the widths being taken from the plan. The next problem is to obtain the true lengths of lines CG and DH and position them on the pattern; this can be done easily by the construction of two triangles, after the insertion of line DG.
